

Feeder Kit

Now, we have developed a completely new design and construction of a feeder kit of the highest quality. The motor is placed “upside down” inside the Feeder Kit. This positioning protects the motor from external disturbance. The motor is equipped with a long shaft that goes down to the spin plate. The spin plate is placed at the end of the shaft and is adjustable in height.

The spin plate is provided with a side protection, which automatically folds down and prevents food from falling out when the plate stops spinning. These side protections has a great advantage, for example when feeding wild boar, deer, etc. which may otherwise have a tendency to push the feeder to shake down more food.

Assembly:

The Feeder Kit is mounted directly under the feeder container. Depending on the design of the various feeders, the different mounting holes may be used in the best way. The opening of the feed container to the Feeder Kit needs a diameter of 16 cm.

Connect Feeder Kit to FeedCon by plugging the cable from Feeder Kit into the motor input.

Connect the Feeder Kit and FeedCon to the app:

1. Follow the Installations manual included in the FeedCon box.
2. At the option Choose model in FeedCon app: Select Nordic Gamekeeper NG SP
3. Then follow the app's further instructions.
4. Now the Feeder Kit is connected to your FeedCon.
